Dear Sir,

Your ref: CC Docket No. 94 -102

Our Ref: GPNS Corp.

I write to you today, in part, with reference to a meeting I attended that took place Monday September 22nd 1997 at the Office of the Secretary of the FCC. Also present were; Mr. John Cimko, Chief, Policy Division, Wireless Telecommunications Bureau, Nancy Booker, Deputy Chief, F. Ronald Netro, Senior Engineer and Won Kim.

I described that I had been informed of the grant of my first US Patent and we debated the implications and potential impact of my ownership of the intellectual property. I also briefed them as to my intention to create a new business that would be USA based and described the service that would be created. In fact, since that meeting I have been granted a second US Patent and a Japanese Patent also. Now the time has come to move forward and I can announce our plans.

We are about to launch what will be seen as the definitive personal security system that involves the use of portable wireless transmitters that combine a camera and navigation. We hold strong Patents for the system and we are advised we can state:

The patented system permits any individual, or any portable product, at any point upon the globe of the planet, to transmit an electronic image, (including full motion video), which includes navigational information plus sound to a remote base station. The base station receiver in turn converts that transmission into a video image, a printed image and an accurate location projected onto a map. The system will use established protocols for transmission over existing carriers without the need for additional investment by the carrier. The defined marketplace is any personal corporate or military use that can be made from the system. We control the portable device, the operating system for the device, the software in the device, the right to transmit between the device and a base station, the base station itself, the base station operating system and all other related software.

MAIL ROOM

GPNS Corp. is about to address the primary wireless marketplace with a much better solution than that proposed in the FCC proposals for E911. We refer you to our web site: <http://www.gpns.com>

It goes without saying that we cannot project ourselves as manufacturers of product. Instead, we have set out as a first stage to demonstrate that my original concept is correct, i.e. that a local franchise in small communities and a larger corporate entity within major cities and metropolitan areas is sustainable as a business; that our perceived market place exists in reality. We believe that all else will follow our demonstration of our market.

We believe that our plans will result in the creation of a substantial number of new jobs spread throughout America. We will also drive the development and production of new telecommunications equipment, from new hand sets to base stations, with the added bonus of a full world market for both our franchise and the related equipment.

The most recent tragic events have clearly illustrated the benefits that flow from wider use of wireless as a means towards better personal security. Now, we create a new market that takes wireless security into a completely new dimension.

We want to make it abundantly clear; we will be pleased to work with anyone with a commitment to the introduction of more effective measures that ensure better protection for the individual citizen. However, there are further issues that both relate to the above conversations as well as events that have occurred more recently.

This is not an easy subject to open. We have the greatest respect for the workings of the Federal Communications Commission, but we also have been granted Patent rights by another branch of Government that impinges upon the workings of the FCC.

We enjoy "the right to exclude others from making, using, offering for sale, or selling....."

We ask if there has been adequate consideration of the matter of the grant of licenses.

1. Whether for transmission between a portable wireless transmitter and a base station,
2. Or, for example, Location and Monitoring Services.

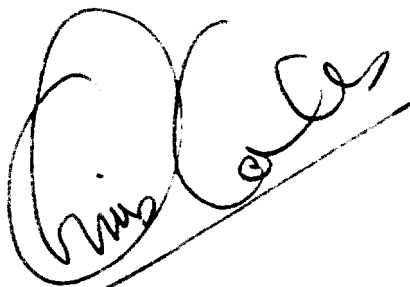

Have such potential licensees, (in particular where it must have been known from the outset, that there would be conflict with the already granted US Patent rights that give us now our intellectual property base), been kept informed that our own right to grant a license might well impinge upon the license being sold by the FCC?

Has consideration been given to the need to recompense us for the royalty income that will entail from the grant of such licenses?

I can well understand that the FCC, having been charged with the control of the use of radio spectrum, may well say that such use is incidental to our rights. We will argue otherwise.

We will welcome the opportunity to participate in conversations that will lead to a better understanding of the absolute commitment of the founders of GPNS Corp. to the establishment of what will be seen as the definitive solution to the personal security of the citizen and the creation of a strong world market for the related equipment.

Yours faithfully,

A handwritten signature in black ink, appearing to read "Chris Coles", written over a horizontal line.

Chris Coles
